Background Information

The WNT gene family consists of structurally related genes which encode secreted signaling proteins. There are 19 Wnt genes in the human genome that encode functionally distinct Wnt proteins. These proteins have been implicated in oncogenesis and in several developmental processes, including regulation of cell fate and patterning during embryogenesis. Wnt members bind to the Frizzled family of seven-pass transmembrane proteins and activate several signaling pathway.

Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 87705-1-RR (WNT5A antibody) at dilution of 1:1000 incubated at room temperature for 1.5 hours.

Biolayer interferometry (BLI) kinetic assays of 87705-1-RR against Human WNT5A/B were performed. The affinity constant is below 1 pM.
