| Background Information | Interferon gamma (IFN $\gamma$ ), is a type II interferon that provides immunity against bacterial, viral and protozoan infections. In its active form, IFN $\gamma$ is a glycosylated, non-covalently linked homodimer of 29-32 kDa subunits. It is produced by a number of immune cell types including natural killer cells, natural killer T cells, and effector lymphocyte T cells following antigenic and inflammatory triggers. The IFN $\gamma$ dimer binds to its cognate receptor which has two subunits: IFN- $\gamma$ R1 which is the ligand-binding chain ( $\alpha$ chain) and IFN- $\gamma$ R2, the signal-transducing chain ( $\beta$ chain). Binding to the receptor activates the JAK/STAT pathway which in turn activates IFN $\gamma$ responsive genes. While IFN $\gamma$ can inhibit viral replication, it also works as an immune-modulator and immune-stimulator by increasing surface expression of class I MHC proteins. (PMID: 19268625; 10688427) |                                             |                                               |

This product is exclusively available under Proteintech Group brand and is not available to purchase from any other manufacturer.

## Selected Validation Data

1x10<sup>^6</sup> untreated or PMA, lonomycin and Brefeldin A treated C57BL/6 Th1-polarized splenocytes were intracellularly stained with O.25 ug Anti-Mouse IFN-gamma Rabbit Recombinant Antibody (98045-1-RR, Clone:240262C9) and PE-conjugated Goat Anti-Rabbit IgG. Cells were then stained with CoraLite® Plus 647 Anti-Mouse CD4. Cells were fixed with 4% PFA and permeabilized with Flow Cytometry Perm Buffer (PF00011-C). This data was developed using the same

Biolayer interferometry (BLI) kinetic assays of 98045-1-RR against Mouse IFN-gamma were performed. The affinity constant is below 1 pM.
