Background Information

The Ki-67 protein (also known as MKI67) is a cellular marker for proliferation. Ki67 is present during all active phases of the cell cycle (G1, S, G2 and M), but is absent in resting cells (G0). Cellular content of Ki-67 protein markedly increases during cell progression through S phase of the cell cycle. Therefore, the nuclear expression of Ki-67 can be evaluated to assess tumor proliferation by immunohistochemistry. It has been demonstrated to be of prognostic value in breast cancer. In head and neck cancer, several studies have reported an association between high proliferative activity and poorer prognosis.

Selected Validation Data

1x10⁶ untreated or Con A-treated mouse splenocytes were intracellularly stained with FcZero-rAb™ PE Anti-Mouse CD3 ϵ and 0.1 μ g APC Anti-Mouse Ki-67 Rabbit RecAb (APC-FcA98224, Clone: 241768E2). Cells were fixed and permeabilized with True-Nuclear Transcription Factor Buffer Set.
