Background Information

Activated leukocyte cell adhesion molecule (ALCAM, also known as CD166) is a cell adhesion molecule that belongs to the immunoglobulin superfamily. It is involved in cell-cell adhesion through homophilic and heterophilic (to CD6) interactions. ALCAM is widely expressed in a variety of normal tissues and cell types, including activated T cells and monocytes, epithelial cells, fibroblasts, neuronal cells, hepatocytes, and bone marrow mesenchymal stem cells (PMID: 7760007; 25221999). Altered ALCAM expression has been associated with the differentiation state and progression in some neoplasms including melanoma, prostate, colorectal, and breast cancers (PMID: 20461761; 18172759).

Selected Validation Data

1x10^6 PHA-treated human PBMCs were surface stained with 0.25 ug Biotin Anti-Human ALCAM (3A6) Mouse IgG2a RecAb (Biotin-65611, Clone: 3A6) (red) or unstained (blue), and Streptavidin-PE Conjugate (PE-PF00030). 1x10^6 untreated human PBMCs were surface stained with 0.25 ug Biotin Anti-Human ALCAM (3A6) Mouse IgG2a RecAb (Biotin-65611, Clone:3A6) and Streptavidin-PE Conjugate (PE-PF00030) (black, dashed). Cells were not fixed.
