Background Information

HLA-DR is a member of MHC class II moleculesencoded by the human leukocyte antigen complex on the region 6p21.31 of chromosome 6. HLA-DR is composed of two non-covalently associated transmembrane glycoproteins (the α and β chains), and is primarily expressed on B lymphocytes, monocytes, dendritic cells and thymic epithelial cells (PMID: 33125816). HLA-DR participate in the antigen presentation to CD4+ or CD8+ T cells and is postulated as a general biomarker of sepsis-induced immunosuppression (PMID: 28199206, 32421903).

Selected Validation Data

1x10^6 human PBMCs were surface stained with CoraLite® Plus 647 Anti-Human CD14 and 5 ul CoraLite® Plus 405 Anti-Human HLA-DR (L243) Mouse IgG2a Recombinant Antibody (CL405-65560, Clone: L243), or CoraLite® Plus 405 Mouse IgG2a Isotype Control (C1.18.4) (CL405-65208, Clone: C1.18.4). Cells were incubated with FC Receptor Block prior to staining. Cells were not fixed.
