## Background Information

UDP-glucose 6-dehydrogenase (UGDH) is a key enzyme in the uronic acid pathway, and converts UDP-glucose (UDP-Glc) to UDP-glucuronic acid (UDP-GlcA). UGDH is critical to the production of extracellular matrix components which are essential to the migration and connectivity of neurons early in human brain development. UDP-GlcA is an essential sugar nucleotide precursor and a key component in the synthesis and stepwise degradation of glycosaminoglycans (GAGs). The protein subunit migrates on SDS-PAGE at ~55 kDa. (PMID: 32175296, PMID: 21576248, PMID: 31243371).
