## Background Information

The exocyst is a protein complex that ensures spatial targeting of exocytotic vesicles to the plasma membrane. Exocyst complex component 3-like 2 (EXOC3L2) associates with the exocyst complex and mediates directional migration of endothelial cells (PMID: 21566143). The gene of human EXOC3L2 maps to chromosome 19q13.32 and encodes a deduced 409-amino acid protein with a calculated molecular mass of about 46 kDa. Mouse Exoc3l2 gene encodes an approximately 250-amino acid protein that lacks the N-terminal domain of human EXOC3L2. Mutations in EXOC3L2 gene may be associated with Alzheimer's disease.
