## **Background Information**

BCL3 (B-cell lymphoma 3 protein) has seven ankyrin repeat domains, a proline-rich N terminal domain and a serineand proline-rich C-terminal domain (PMID: 31930327). BCL3 is an important contributor to chronic inflammatory disease states, such as osteoarthritis and rheumatoid arthritis (PMID: 12483727). BCL3 is a predominantly nuclear protein containing a trans-activation domain, and it can be recruited to NF-  $\kappa$  B-responsive promoters, resulting in transcriptional activation or repression depending on the subunit composition of NF-  $\kappa$  B complexes (PMID: 25089799, PMID: 30135206). BCL3 is known to be overexpressed in human breast cancers and is associated with reduced metastasis-free survival (PMID: 38255248).
