Background Information

CHMP6 (charged multivesicular body protein 6) is a protein that plays a significant role in the formation of multivesicular bodies (MVBs) within cells. It is a component of the endosomal sorting complex required for transport III (ESCRT-III), which is involved in the sorting and transport of proteins within the cell. CHMP6 has been identified as a novel prognostic biomarker in bladder cancer, where it enhances cell survival and migration by regulating the cell cycle. (PMID: 40630215)
