Background Information

Interferon gamma (IFNG) is a soluble cytokine that is the only member of the type II class of interferons. It is secreted by Th1 cells, cytotoxic T cells and NK cells. The cytokine is associated with antiviral, immunoregulatory and anti-tumor properties and is a potent activator of macrophages. It plays crucial roles in pathogen clearance. Aberrant IFNG expression is associated with a number of autoimmune and inflammatory diseases. It has been identified in many studies as a biomarker for pleural tuberculosis (TB). Mutations in this gene are associated with aplastic anemia.

Selected Validation Data

1X10⁶ PMA+ionomycin+protein transport inhibitors treated for 6h human PBMCs were intracellularly stained with 0.25 ug CoraLite® Plus 647 Anti-Human IFN Gamma (CL647-69007, Clone:1E10G7), and 0.25 ug CoraLite®488 Anti-Human CD3 (UCHT1) (CL488-65151, Clone: UCHT1). Cells were fixed with 4% PFA and permeabilized with Flow Cytometry Perm Buffer (PF00011-C).
