Background Information

Epidermal Growth Factor Receptor (EGFR) is one of the receptor tyrosine kinases (RTKs), members of the ErbB/HER family which consists of ErbB1 (EGFR or HER1), ErbB2 (HER2 or Neu), ErbB3 (HER3), and ErbB4 (HER4). Phosphorylation at Tyr1016 is essential for the recruitment of downstream signaling molecules. For example, it can interact with adapter proteins like GRB2, which in turn activates the Ras-MAPK pathway, leading to cell proliferation and differentiation. (PMID: 26628682) Some scientists call EGFR Tyr1016 as EGFR Tyr992, the site where the signaling peptide is removed.
