Applications
Tested Applications:
WB
Positive Controls:

Species Specificity:
human, mouse, rat, nematode, pig, zebrafish

Background Information
There are five tubulins in human cells: alpha, beta, gamma, delta, and epsilon. Tubulins are conserved across species. They form heterodimers, which multimerize to form a microtubule filament. An alpha and beta tubulin heterodimer is the basic structural unit of microtubules. The heterodimer does not come apart, once formed. The alpha and beta tubulins, which are each about 55 kDa MW, are homologous but not identical. Alpha and beta tubulins have been widely used as loading controls. Tubulin expression may vary according to resistance to antimicrobial and antimitotic drugs.

Storage
Storage:
Store at $-20^{\circ} \mathrm{C}$. Avoid exposure to light. Stable for one year after shipment.
Storage Buffer:
PBS with $50 \%$ Glycerol, $0.05 \%$ Proclin300, $0.5 \%$ BSA, pH 7.3 .
Aliquoting is unnecessary for $-20^{\circ} \mathrm{C}$ storage

Selected Validation Data

Various lysates were subjected to SDS PAGE
followed by western blot with CL750-66240 (Beta
Tubulin antibody) at dilution of 1:4000 incubated at room temperature for 1.5 hours.
