## Background Information

CD35, also known as complement receptor type 1 (CR1) or C3b/C4b receptor, is a single-chain glycoprotein consisting of 30 repeating homologous protein domains known as short consensus repeats (~60 amino acids each) followed by transmembrane and cytoplasmic domains (PMID: 8765013). CD35 is variably expressed by granulocytes, monocytes, B cells, some T cells, erythrocytes, follicular dendritic cells, Langerhans cells, and glomerular podocytes (PMID: 19004497). CD35 acts as a receptor for C3b and C4b and plays important roles in the regulation of the complement cascade and clearance of immune complexes.

## Selected Validation Data

1X10<sup>6</sup> human PBMCs were surface stained with 5 ul FITC Plus Anti-Human CD35 (FITC-65254, Clone: E11), or Mouse IgG1 Isotype Control. Cells were not fixed. Lymphocytes were gated.
