## Background Information

Keratins are a large family of proteins that form the intermediate filament cytoskeleton of epithelial cells, which are classified into two major sequence types. Type I keratins are a group of acidic intermediate filament proteins, including K9-K23, and the hair keratins Ha1-Ha8. Type II keratins are the basic or neutral counterparts to the acidic type I keratins, including K1-K8, and the hair keratins, Hb1-Hb6. KRT18, also named as CYK18, PIG46 and K18, is the most commonly found members of the intermediate filament gene family. KRT18 is a type I keratin which is found primarily in non squamous epithelia and is present in a majority of adenocarcinomas and ductal carcinomas but not in squamous cell carcinomas.

## Selected Validation Data

Immunofluorescent analysis of (-20°C Methanol) fixed HeLa cells using FITC Cytokeratin 18 antibody (FITC-66187, Clone: 1G11C4) at dilution of 1:200.

1X10<sup>6</sup> HeLa cells were intracellularly stained with 0.4 ug FITC Anti-Human Cytokeratin 18 (FITC-66187, Clone:1G11C4) (red), or 0.4 ug Control Antibody. Cells were fixed with 4% PFA and permeabilized with Flow Cytometry Perm Buffer (PF00011-C).
