Background

METTL3 is a key S-adenosyl-L-methionine-binding subunit, which is component of a complex multicomponent enzyme that catalyzes the methylation of internal adenosine residues in eukaryotic mRNA, forming N6-methyladenosine. It contains 2 putative nuclear localization signals and 2 consensus methylation motifs. It also regulates mRNA translation and other biological processes.

Synonyms

IME4, M6A, methyltransferase like 3, METTL3, MT A70, MTA70, Spo8
