Background

Complement receptor type 1 (CR1), also known as C3b/C4b receptor or CD35, is a single-chain glycoprotein consisting of 30 repeating homologous protein domains known as short consensus repeats (~60 amino acids each) followed by transmembrane and cytoplasmic domains. CR1 is variably expressed by granulocytes, monocytes, B cells, some T cells, erythrocytes, follicular dendritic cells, Langerhan cells and glomerular podocytes. CR1 acts as a receptor for C3b and C4b and plays important roles in regulation of the complement cascade and clearance of immune complexes. A soluble form of CR1 (sCR1) has been found in plasma. It has been reported that sCR1 is produced by a proteolytic cleavage in the C-terminal region of CR1 transmembrane domain.
