## Background

Factor XIIIa is a blood proenzyme that catalyzes intermolecular cross-linking of fibrinogen and is involved in clotting cascade. It has been identified in various tissues including placenta, uterus, and prostate. Anti- Factor XIIIa has been found to be useful in differentiating between dermatofibroma (90% positive) and desmoplastic malignant melanoma (negative). Factor XIIIa positivity is also seen in capillary hemangioblastoma, hemangioendothelioma, hemangiopericytoma, xanthogranuloma, xanthoma, hepatocellular carcinoma, glomus tumor, and meningioma.

## Synonyms

Coagulation factor XIIIa, F13A, F13A1, Factor XIIIa, Transglutaminase A chain

## Selected Validation Data

Immunohistochemical analysis of paraffin-embedded human liver cancer tissue slide using KHC0739 (F13A1 IHC Kit).
