Background

Keratins are a large family of proteins that form the intermediate filament cytoskeleton of epithelial cells, which are classified into two major sequence types. Type I keratins are a group of acidic intermediate filament proteins, including K9-K23, and the hair keratins Ha1-Ha8. Type II keratins are the basic or neutral counterparts to the acidic type I keratins, including K1-K8, and the hair keratins, Hb1-Hb6. Keratin 33 belongs to type I keratin and is found in hair and nails. There are two isoforms of this protein, encoded by two separate genes, KRTHA3A and KRTHA3B.

Synonyms

Ha 3II, HA3II, Hair keratin, type I Ha3 II, hHa3 II, HKA3B, K33B, keratin 33B, KRT33B, KRTHA3A, KRTHA3B
