Background

PSMB4(Proteasome subunit beta type-4) is also named as PROS26 and belongs to the peptidase T1B family. The proteasome is a multicatalytic proteinase complex which is characterized by its ability to cleave peptides with Arg, Phe, Tyr, Leu, and Glu adjacent to the leaving group at neutral or slightly basic pH. The human protein PSMB4 is known mainly as an interaction partner for several proteins, suggesting an important function of binding not only to the lid, but also to the 20 S core of the proteasome. PSMB4 might be a major site for proteasome regulation, where signals from the outside might be transduced to the protease activities inside.
