Background

SRRT (Serrate RNA effector molecule homolog) is also named as ARS2 (Arsenite-resistance protein 2). ARS2/SRRT is an essential eukaryotic protein that has emerged as a critical factor in the sorting of functional from non-functional RNA polymerase II (Pol II) transcripts. SRRT protein is a key component of the nuclear cap-binding complex (CBC), which allows it to modulate the expression of various miRNAs. The SRRT protein is widely expressed throughout the eukaryotes, but not in budding yeast. SRRT has been shown to play a vital role in stem-cell renewal, proliferation, hematopoiesis, and RNA-mediated gene silencing and regulation of miRNA biogenesis. SRRT is involved in cellular proliferation and colony formation (tumorigenicity). Similarly, high SRRT expression has been found in cholangiocarcinoma. ARS2 showed ubiquitous expression, with the highest levels in mouse testes, heart, and liver and human heart and skeletal muscle.
