Background

UBE2C (Ubiquitin-conjugating enzyme E2 C) is also known as UBCH10 and belongs to the ubiquitin-conjugating enzyme family. It is highly expressed in a variety of human primary tumors, and it is able to promote cell proliferation and malignant transformation. UBE2C, along with the E3 ligase of the anaphase promoting complex (APC), catalyzes the ubiquitination of mitotic cyclins A and B, as well as securin. UBE2C is essential for cell cycle progression, and mutation of its active site cysteine confers a dominant-negative phenotype.

Synonyms

UbcH10, UB E2C, EC:2.3.2.24, EC:2.3.2.23, E2 ubiquitin-conjugating enzyme C
