Background

The family of LIM kinase (LIMK) includes two similar proteins, LIMK1 and LIMK2, that share overall identity of 53% with 75%, 55%, and 42% amino acid identity in the LIM, kinase, and PDZ domains, respectively. LIMK2 regulates actin cytoskeletal reorganization through phosphorylating and inactivating cofilin, an actin-depolymerizing factor of actin filaments. It also may associate with gamma-tubulin and play a role in mitotic spindle assembly.

Synonyms

LIMK-2, LIMK 2, LIM domain kinase 2, EC:2.7.11.1
