| Background Information | CD19 is a 95 kDa type I transmembrane glycoprotein belonging to the immunoglobulin superfamily (PMID: 2472450). It is expressed by B cells and follicular dendritic cells. CD19 is up-regulated at the step of B-lineage commitment during the differentiation of the hematopoietic stem cell, it remains on during subsequent stages of differentiation until finally down-regulated during terminal differentiation into plasma cells (PMID: 8528044). CD19 is involved in B cell development, activation and differentiation. It is the dominant component for the signaling complex on B cells that includes CD21 (CR2), CD81 (TAPA-1) and CD225 and acts as a critical co-receptor for BCR signal transduction (PMID: 23210908). | | |

Selected Validation Data

1X10^6 human PBMCs were surface co-stained with CL750 Anti-Human CD3 and 5 ul PE Anti-Human CD19 (PE-65110, Clone: HIB19) or Mouse IgG1 Isotype Control. Cells were not fixed. Lymphocytes were gated.

1X10[^]6 human PBMCs were surface stained with 5 ul PE Anti-Human CD19 (PE-65110, Clone: HIB19) (red) or Mouse IgG1 Isotype Control. Cells were not fixed. Lymphocytes were gated.
