Background Information

CD123, also referred to as interleukin-3 receptor subunit alpha (IL-3R α), belongs to the cytokine receptor family. It is a glycoprotein containing an extracellular domain, involving a predicted Ig-like domain, two FnIII domains, a transmembrane domain and an intracellular domain (PMID: 24513123). CD123 is expressed on hematopoietic progenitor cells, plasmacytoid dendritic cells, basophils, monocytes, some B cells, and in a variety of hematologic malignancies (PMID: 10527461; 34855461). IL-3 initially binds to CD123 and subsequently recruits the beta chain (CD131) to form the high-affinity receptor, resulting in the activation of a series of signaling pathways including the JAK/STAT, Ras-MAPK, and phosphatidylinositol 3-kinase pathways (PMID: 29296749). IL-3R signaling regulates the proliferation, survival, and differentiation of hematopoietic cells.

Selected Validation Data

1X10⁶ human PBMCs were surface co-stained with CL647 Anti-Human CD45RO and 5 ul PE Anti-Human CD123 (PE-65256, Clone:HI 12H7), or Mouse IgG1 Isotype Control. Cells were not fixed. Lymphocytes were gated.
