Background Information

CD70 is the membrane-bound ligand of the CD27 receptor, which belongs to the tumor necrosis factor receptor superfamily. CD70 is not expressed in non-lymphoid normal tissue but is overexpressed in tumor cells of various solid cancers, diffuse large B-cell and follicular lymphoma and the malignant cells of Hodgkin lymphoma, Waldenström macroglobulinemia, and multiple myeloma (PMID: 28651374, 20699361). CD70/CD27 interactions play an important role in providing co-stimulation during the development of functional lymphocytes; strict control of CD70 expression is required for optimal signaling for immune cell activation (PMID: 21304103).
